Federally Registered Pesticides for Vertebrate Pest Control

by

Raymond W. Matheny, Wildlife Biologist  
Ecological Effects Branch  
Hazard Evaluation Division  
Environmental Protection Agency  
Washington, D.C.

At the 1978 Vertebrate Pest Conference, Glenn Hood talked of vertebrate control chemicals, their registration status at that time, the rebuttable presumptions against registration and effects on users. He presented an overview of reregistration, classification, labeling, application certification, experimental use permits, emergency use and state registrations. Essentially, what he stated is as true today as when he addressed this conference. I'll try not to duplicate his fine presentation but rather give you an update about those long awaited for and somewhat controversial Guidelines for registering pesticides in the United States, the current status of strichnine and 1080 in the RPAR process, review briefly the latest congressional amendments to the Federal Fungicide, Insecticide and Rodenticide Act (FIFRA) under which EPA conducts its pesticide programs and, finally, give you a listing of the current federally registered pesticides for use in vertebrate pest control.

It is appropriate to first briefly review the function of EPA in the pesticide arena and outline the current organization. You are aware, of course, that EPA has a number of responsibilities: these include air, noise, radiation, water, waste management, pesticides, and toxic substances. The Agency is charged by Congress under FIFRA, as amended, to regulate the use of pesticides in the United States. To conduct this activity the Office of Pesticide Programs, within the Office of Pesticide and Toxic Substances is comprised of five Divisions:

Registration, Hazard Evaluation (HED), Benefits and Field Studies, Special Pesticide Review and Program Support. I am currently assigned to the Ecological Effects Branch of HED. The four other branches in HED are Toxicology, Environmental Fate, Residue Chemistry, and Health Effects. Of the 27 sections in FIFRA we deal routinely with Section 3 (Registrations), 5 (Experimental Use Permits), 18 (Emergency Use Permits, Crisis Exemptions), and 24(c) (State Special Local Needs).

Guidelines

I wish that I could announce to you that my Agency has published the final Guidelines for Registering Pesticides in the United States. For several years over 200 persons within the Agency have contributed to drafting these Guidelines to inform registrants and the public about the registration process, procedures to follow, and test standards and requirements for the many kinds of pesticide products. On June 25, 1975, the Agency first published proposed Guidelines for Registering Pesticides in the U.S. These proposed guidelines describe the kinds of data which must be submitted to satisfy requirements of the registration regulations. They include sections explaining the scope and the intent of the guidelines; detailing the product performance, hazard evaluation and chemistry data requirements for registration of a pesticide product, and providing guidance on proper label development.

It is the intent of the Agency that Guidelines provide meaningful instruction to applicants, registrants, and the general public on the specific data requirements for registration of a pesticide product.

The Agency since 1975 has published four subparts: B, D, E and F which establish the requirements for product chemistry, environmental chemistry, fish and wildlife toxicity data and toxicology data for human and domestic animal safety evaluation.

In March 1980 three subparts (G, I and J) will be published as proposed. They deal with product performance, experimental use permits, and hazard evaluation to nontarget plants and microorganisms, respectively. Other subparts to be published in late 1980 involve label development, hazard evaluation to nontarget insects and proposed guidelines for registering biochemical and microbiological pesticides.

#### RPAR

There have been delays in the processing of some 50 pesticides involved in the Agency's "Rebuttable Presumption Against Registration" (RPAR). Recently the Special Pesticide Review Division rescheduled completion periods for a number of RPAR compounds. By October of this year position documents 2 and 3 are to be completed for both strychnine and 1080. For those of you not familiar with the RPAR process, it is one of gathering data, both on the hazards and the benefits of a particular chemical and use pattern. The process determines whether a particular pesticide will be afforded continued use as previously registered or requested to be registered, restricted use or cancellation and removal from the market. Section 162.11 (a)(3)(B), (C) of FR. Vol. No. 129 lists the criteria for determinations of unreasonable adverse effects of pesticides. An RPAR shall arise if a pesticide's ingredient(s), metabolite(s) or degradation product(s) meet or exceed certain criteria for risk. These include acute toxicity to humans and domestic animals, hazard to wildlife and chronic toxicity which can reasonably be anticipated to result in local, regional, or national population reductions of nontarget organisms, or fatality to members of endangered species. In the final analysis the benefits are weighed against the risks and the Administrator renders the ultimate decision. The outcome of the RPAR does not, as some imagine, mean automatic cancellation of a product. It may result in label amendments, changes in use patterns, dosage rates or restrictions as to who is authorized to handle the pesticide. There could be very little, or extensive, alteration in labeling. In any event, the RPAR process is intended to reduce environmental hazards in the use of pesticides.

#### Congressional Amendments to FIFRA

As far as vertebrate pesticides are concerned, the September 1978 congressional amendments to FIFRA, apply primarily to the waiver of some pesticide efficacy requirements. However, they do not apply to those pesticides which may impact on public health, such as commensal rodenticides. Thus, efficacy data requirements remain in force for products used to control commensal rats and mice, potential rabies vectors (e.g., bats, skunks, raccoons, canids), significant plague vectors and birds in

situations where potential threat of disease is a primary reason for control. However, the waiver of efficacy data for most pesticidal products is experimental. All, or some, waived requirements may be enforced at any time by the Administrator, if product failure is reported. A risk/benefit analysis will be conducted prior to conditional registration of all products which contain active ingredients that have been cancelled, suspended or are subject to RPAR proceedings.

Of the approximate 35,000 pesticides containing some 1400 active ingredients, only 1100 comprise the vertebrate pesticides. As Glenn Hood indicated two years ago, the number of new registrations for use in vertebrate pest control are few.

The appended tables show, by category, which products are currently registered. Anyone who wishes to inquire further about the status of any product should contact either William Miller or Dan Peacock of EPA's Office of Pesticide Programs, Registration Division/Insecticide, Rodenticide Branch at (202) 426-9458.

#### Summary

Vertebrate pesticides include lethal agents; irritants; repellents based on odor, taste, postigestional psychophysiological reaction or pharmacological reaction; repellents based on mechanical action such as tackiness or stringiness; anesthetizing chemicals, reproductive inhibitors; and fumigants.

Vertebrate pesticides, properly used, can benefit man by controlling offending animals; whether rats or mice, gophers or prairie dogs, black birds or pigeons, starlings or gulls. However, vertebrate pesticides like all pesticides, if used improperly, can endanger man and nontarget species due to their toxicity. In addition, potential future hazards to human health and wildlife may be created by residues from some long lived pesticides that build up in the food chain and cause widespread contamination of the environment. The EPA endeavors to regulate pesticides under FIFRA to prevent misuse and adverse environmental effects.
